## **Ford E Series Installation Instructions**

Locate and remove lower dashboard panel under steering wheel. Locate and remove steering column cover.

Find a solid place to ground the black wire from SafeStop. We do not recommend sharing ground with any other component.

Unplug factory ignition harness from the steering column and plug it into the female SafeStop factory Ford plug. Then Plug the male SafeStop factory Ford plug into the steering column.

Locate the brake light signal wire. This wire is located just above the brake pedal in the plug. It will show 12V when depressed. DO NOT cut this wire in half. Simply strip back a small section and solder the Green and White brake wire from SafeStop to this wire. We recommend a small piece of OEM grade electrical tape over this splice.

Drill a 3/4 inch hole to the left of the steering column on the dash molding. The plastic molding is removable. It is recommended that the molding be removed as there may be obstructions behind. The switch should be properly centered with the space in the dashboard behind the molding.

Fish the switch harness through the factory hole. Plug the switch harness into the switch. Fasten module to a secure location under the dashboard. Test and re-assemble car.

**NOTE: It is very important to follow the attached switch installation instructions to avoid possible damage to the unit. i.e. Orange = Ground #3, Purple = Load #2, Pink = Hot #1 on switch.**

SafeStop is equipped with an extra 12 volt supply (white wire). This wire is not necessary for the E Series. If this wire is used to power up any other accessories we recommend using a relay as this wire should not be used for more than 5 amps. If this wire is not to be used it should be terminated properly with shrink boot or OEM grade electrical tape.

**SafeStop is also equipped with a Brown gunlock 12V supply wire. Please refer to your manufacturers instructions for use of this wire or call (800) 328-1954 for assistance.**
